

CSS Grid

Grid Container
display: grid

Column Gap

Row Gap

Grid Cell

Grid-items

Grid lines → Gap around Grid Lines → Gutter

CSS Grid

CSS Grid

- CSS grid is a two-dimensional layout model with rows and columns to design web pages.
- CSS grid avoids using float and positioning.
- The grid layout must have a **parent element(container)** with the **display** property "**grid**" or "**inline-grid**". So that the child elements of the container automatically become **grid items**.

- Fast & Clean Code
- No need of CSS Frameworks

Important Terminologies

Terminologies	Description
grid columns	The vertical lines of the grid items
grid rows	The horizontal lines of the grid items
grid gaps	The space between each row or column. <code>grid-gap: 50px 100px;</code> The space between each row is called the row gap. <code>grid-row-gap: 50px;</code> The space between each column is called a column gap. <code>grid-column-gap: 50px;</code>
grid lines	The line between each row or column. The line between each line is called the row line. The line between each line is called the column line. The lines are used to place the items in the container by using the following properties: <ul style="list-style-type: none">• <code>grid-column-start</code>• <code>grid-column-end</code>• <code>grid-row-start</code>• <code>grid-row-end</code>

Grid Container properties

Grid Item properties

Difference between Flex and Grid

Example

Grid Container Properties

Property: grid-template-columns

Value: Width of each column or auto.

Description: Defines the number of columns and their width in the grid.

Code:

```
grid-template-columns: auto auto auto auto auto;
```

Output:

Grid Container Properties

Property: grid-template-rows

Value: Height of each row or auto.

Description: Defines the number of rows and their height in the grid.

Code:

```
grid-template-columns: auto auto auto;  
grid-template-rows: 80px auto;
```

Output:

1	2	3
4	5	6

Handwritten notes:
width → value ⇒ 55% 20px auto
1fr 1fr 2fr
fr → fraction
repeat(3, 150px)
repeat(2, 150px) 1fr

Example

Grid Container Properties

Property: justify-container

Value: space-evenly, space-around, space-between, center, start, end.

Description: Used to align the whole grid inside the container. The total width of the grid must be less than the container's width to add this property.

Code:

```
.grid-container {  
  display: grid;  
  width: 300px;  
  /*Make the grid smaller than the container*/  
  grid-template-columns: 50px 50px 50px;  
}
```

Difference between Flex and Grid

CSS Flex	CSS Grid
One-dimensional layout can work on either row or column at a time.	Two-dimensional layout can work on rows and columns at a time.
Best suitable for application components and small-scale layouts.	Designed for large-scale layouts that are non-linear in design.
Helps to align contents.	Helps to design the outer layout of the web page.
Content first.	Layout first.
